I really wanted to try Linux because I'm tired of all the viruses that my Windows computer acquires despite having an anti-virus installed. I've been told that having a Linux-based OS means you won't get ANY computer virus and you don't need to install an anti-virus at all. That's pretty awesome, right? Well, I searched a bit and it looks a little complicated than I imagined. It's quite geeky , too. I couldn't understand almost all of the things I've read in that article I read so I grabbed this book instead since its target audiences are beginners like me.The title of the book "Linux: The Beginners Crash Course" speaks for itself. As someone who barely knows a thing about it, this book is a pretty comprehensible one compared to that article I read. It covered the basics and fundamentals of Linux and although it didn't discuss what kind of OS I could use (there was a list of linux distribution though), it was a pretty good book to start reading with. Actually, I think the details here are necessary to understanding the OS later on.
